

Copper plates for various distribution boxes

AI Overview

Copper plates and tinned copper bars are essential for efficient, durable, and safe power distribution in distribution boxes and cabinets. Types of Copper Plates and Bars

- 1. Plain Copper Plates and Sheets:** Copper plates are available in various alloys and thicknesses, typically ranging from 3 mm to over 200 mm, and widths up to 4000 mm, depending on the manufacturer. They are highly conductive, corrosion-resistant, and can be custom-cut to fit specific distribution box dimensions. Copper sheets are often used as bus bars or connection plates between the distribution box and wall, providing a reliable path for current.
- 2. Copper Strips and Coil Sheets:** Copper strips are thin, flexible sheets of pure copper or copper alloys, rolled to precise thicknesses. They offer excellent electrical and thermal conductivity, formability, and corrosion resistance. These strips are ideal for complex layouts inside distribution boxes, allowing bending and shaping without cracking.
- 3. Tinned Pressed Riveted Copper Bars:** Tinned copper bars are copper bars coated with a layer of tin to prevent oxidation and corrosion. They are often pressed and riveted for secure connections inside distribution cabinets. Tin plating ensures long-term stability, reduces contact resistance, and improves efficiency in power transmission. These bars can be customized in cross-section, length, hole layout, bending angles, and terminal forms to match specific distribution box requirements.

Advantages

- High Conductivity:** Copper provides excellent electrical conductivity, minimizing energy loss and heat generation.
- Corrosion Resistance:** Tin-plated copper bars resist oxidation, while plain copper naturally forms a protective patina.
- Customizability:** Copper plates and bars can be cut, bent, or shaped to fit unique distribution box designs.
- Durability:** High-purity copper ensures long service life, even under high cu...
