

How big of a distribution box is needed for a small construction site

AI Overview

Small distribution boxes on construction sites typically accommodate 12 interlocked socket-outlets or up to 60 DIN modules, with portable designs for easy handling. Typical Configurations and Capacities Small construction site distribution boxes are designed for temporary power distribution and are often mobile or transportable. Common configurations include: Q-BOX4 and Q-BOX6: These thermoplastic boards are highly resistant to impact and weather, suitable for primary and secondary distribution on construction sites. They can house up to 12 interlocked socket-outlets or up to 60 DIN modules depending on the configuration (Gewiss). Mobile and Pedestal Versions: Many small boxes come with handles, floor-mounting supports, or wheeled carriages for easy relocation around the site. Some are certified for construction site use and allow flexible component fitting options. Module Units: Compact distribution boards often use 12-module units as a standard, with expandable options up to 48-60 modules for larger setups. Design and Safety Features Impact and Weather Resistance: Small boxes are typically made from thermoplastic or durable sheet steel, offering protection against UV rays, impacts, and harsh site conditions. Electrical Protection: Each socket or module is usually protected by miniature circuit breakers or fuses, and residual current devices (RCDs) are included to prevent indirect contact. Portability: Handles, brackets, and optional stands or suspension lugs make these boxes easy to move and position on uneven or temporary surfaces. Practical Considerations Selection: Choose a box based on the number of devices, future expansion, and site conditions. Single-gang or multi-gang equivalents are used in industrial or commercial settings, but construction sites typically require modular boxes with multiple socket-outlets or DIN modules. Compli...
