

How to identify an EPN device

Overview

Cisco EPN Manager supports two discovery methods: Ping sweep from a seed device (Quick Discovery). The device name, SNMP community, seed IP address and subnet mask are required. The actions you can perform depend on your user account privileges and the types of devices in your network. You can also view the list of applied and. Using the Cisco® Evolved Programmable Network (EPN) Manager you can determine that an automated protection switch to a backup link has created the condition for recurring, temporary degradations. The easiest way to see what's connected to your network is through your router's web interface: What you'll see varies by router manufacturer, but generally includes: Some modern routers offer. We take you through how to scan and find devices on your network (whether it's a simple home network or a complex corporate network) and showcase the best tools for network discovery.
