

# How to remove the fiber optic router

## AI Overview

To safely remove a fiber optic router, power down the device, carefully disconnect the fiber optic cable by handling the connector gently, and avoid bending or damaging the delicate fiber strands.

**Step-by-Step Guide**

- 1. Power Down Devices:** Before touching any cables, turn off your router and any connected devices to prevent electrical issues or data loss.
- 2. Clear Your Workspace:** Ensure the area around the router is clean and free of clutter to avoid accidental damage.
- 3. Identify the Fiber Optic Cable:** Fiber optic cables are thin, flexible, and often labeled “fiber,” “optical,” or “FTTH” (Fiber to the Home). Check the connector type, which may be SC, LC, ST, or FC.
- 4. Handle the Cable Gently:** Avoid twisting, bending, or pulling the cable forcefully. The glass fibers inside are extremely delicate and can be damaged easily.
- 5. Disconnect the Connector:** For push/pull connectors (like SC or LC), press the release tab and gently pull the connector straight out. For bail lever or transceiver connectors, unlock the lever or tab before sliding the cable out. Avoid using excessive force; if the connector is stuck, inspect for debris or damage rather than forcing it.
- 6. Protect the Fiber Ends:** Once disconnected, cover the exposed fiber ends with protective caps if available to prevent contamination or damage.
- 7. Remove the Router:** After the fiber cable is safely disconnected, you can unplug the router's power and any other cables, then carefully lift the router from its location.

**Safety Tips**

Avoid looking directly into the fiber ends, as they may emit invisible infrared light that can harm your eyes. Do not bend the fiber sharply; maintain gentle curves to prevent micro-cracks. Use proper tools like tweezers or a flashlight if needed for visibility, but avoid metal tools that could scratch the fiber.

Following these steps ensures that both your fiber optic cable and router remain undamaged and safe during removal.
