

How to select the quota for distribution boxes

AI Overview

Selecting quotas for distribution boxes involves defining the percentage of supply from each source, setting minimum and maximum quantities, and prioritizing distribution centers to ensure balanced and efficient allocation. Steps to Determine Quotas

1. Define Supply Percentages: Determine the proportion of products or materials each plant or supplier will provide to a distribution center (DC). This ensures that no single source is overburdened and that supply is balanced across the network (SAP Help Portal) .
2. Set Minimum and Maximum Quantities:
 - Minimum Quantity: The smallest lot size that can be allocated to a DC. This prevents the system from splitting very small orders that are inefficient to handle.
 - Maximum Quantity: The largest lot size that can be allocated. This ensures that large orders do not exceed storage or handling capacity at the DC (SAP Help Portal) .
3. Establish Priority Rules: If multiple plants supply the same DC, define which plant should be used first. This can be based on factors like proximity, cost, or production capacity (SAP Help Portal) .
4. Consider Procurement and Lead Times: Include the number of days required to procure materials externally. This helps in planning quotas that align with supply chain timing and avoids stockouts (SAP Help Portal) .
5. Use ERP Tools for Quota Management: In systems like SAP, you can maintain quota arrangements using tools such as the Distribution Network Master Data or the Manage Quota Arrangements Fiori app. These tools allow you to input percentages, lot sizes, and priority rules, and automatically calculate allocations based on demand and supply (SAP Community) .
6. Monitor and Adjust: Regularly review quota performance and adjust percentages or lot sizes as needed to respond to changes in demand, supply disruptions, or seasonal variations.
