

Optical cable coiled around it

Overview

Those are fiber optic cables that are wound back and forth between those "snowshoe" devices, which are used to limit the bend radius of the fiber. Those are needed to avoid propagation losses due to the fiber being bent more than its rated maximum bend radius. most OM3 cable has a minimum bend radius of around 8mm IIRC u/NW6GMP Edit: The minimum bend radius is the smallest allowable radius for a given fiber optic cable to be bent around. The new standard ANSI/TIA/EIA-568B. 3 sets performance. These cables are used mainly for digital audio connections between devices. A fiber-optic cable, also known as an optical-fiber cable, is an assembly similar to an electrical cable but containing one or more optical fibers that are used to carry light. The maximum pulling tension for stranded loose tube cable and ribbon cable is 600 lbF (2,700 Newtons). Then there is this thin yellow wire from the white box to the modem (what is it called?

) it is also bent at 90 deg at a couple of places. Is it okay?

I remember reading.

A fiber-optic cable, also known as an optical-fiber cable, is an assembly similar to an electrical cable but containing one or more optical fibers that are used to carry light. The optical fiber elements are typically individually coated with plastic layers and contained in a protective tube suitable for the environment where the cable is used. Different types of cable are used for fiber-optic communication in different applications, for exa
