

# Overseas Warehouse Aggregation Switch LPO

## AI Overview

Aggregation switches in overseas warehouses can be optimized with Linear Pluggable Optics (LPO) to provide high-speed, redundant, and cost-efficient connectivity for server-to-switch and switch-to-switch links. Aggregation Switch Overview Aggregation switches serve as the distribution layer in a warehouse network, connecting multiple access switches and providing high-throughput uplinks to the core network. They support hierarchical network architectures, redundancy, and single IP management, which simplifies operations in large-scale deployments. Features like Virtual Port Channel (VPC/MC-LAG), stacking, and redundant power supplies ensure high availability and fail-safe operation. Port Aggregation and Link Management Port aggregation allows multiple physical ports to be grouped into a single logical link, providing load balancing and redundancy. Key points include: Static aggregation (ON mode): Ports are manually added to a group without negotiation. Dynamic aggregation (Active/Passive modes): Uses Link Aggregation Control Protocol (LACP) to negotiate links with connected devices. Consistency requirements: All ports in an aggregation group must have matching STP settings, VLAN configurations, speed, duplex mode, and link type. Aggregation simplifies redundant uplinks from access switches to the aggregation switch, ensuring minimal downtime in case of a port failure. LPO Integration Linear Pluggable Optics (LPO) are DSP-free optical modules designed to optimize power, cost, and latency in high-speed networks. In an overseas warehouse scenario: LPO modules can connect Dell PowerSwitch aggregation switches to servers equipped with Broadcom Thor 2 NICs. LPO supports incremental deployment, allowing warehouses to gradually expand high-speed fiber links without replacing existing infrastructure. Certified LPO modules (e.g., 800G-O1...
