

Powering on the distribution box procedure

AI Overview

The power-on procedure for a distribution box involves sequentially removing grounding, verifying switch positions, and carefully closing isolating switches and circuit breakers to safely energize HV and LV circuits.

Safety and Preparation

Confirm personnel safety: Ensure no one is working on any electrical equipment in the distribution room.

Remove temporary grounding and warning signs: Disconnect grounding wires starting from the line end, then the grounding end.

Verify switch positions: Ensure all incoming line switches (e.g., WL1 and WL2) are in the open position.

High-Voltage (HV) Busbar and Incoming Lines

Close bus-tie isolating switch between HV busbars (WB1 and WB2) to allow parallel operation.

Sequentially close isolating switches on the incoming lines (WL1 first), then close the incoming circuit breaker.

Check busbar condition: Successful closing indicates WB1 and WB2 are in good condition.

Close isolating switches for voltage transformer (VT) circuits and verify supply voltage is normal.

HV Outgoing Circuits

Close all HV outgoing isolating switches, followed by HV outgoing circuit breakers to energize main transformers.

Low-Voltage (LV) Side

Close LV-side knife switch of the main transformer, then the LV circuit breaker.

Verify LV busbar voltage using voltmeters to ensure normal operation.

Close all LV outgoing knife switches, then LV circuit breakers (or fuse-switch disconnectors) to energize all LV outgoing circuits.

Additional Considerations

Never operate isolating switches under load.

Ensure proper labeling and neat wiring for maintenance and troubleshooting.

Perform insulation resistance and circuit tests before energizing to confirm safe operation.

Follow manufacturer-specific connector procedures if using modular or Powersafe distribution boxes, ensuring Earth connections are made first and locked properly.

Following this sequence ensures sa...
