

Red warning for fiber optic cables on telecom routers

AI Overview

A red LOS (Loss of Signal) light on a fiber optic router indicates a critical loss of connection between your router and your Internet Service Provider (ISP). What the Red LOS Light Means The red LOS light signals that your router or Optical Network Terminal (ONT) cannot communicate with the ISP due to a loss of signal. This is a critical warning, meaning your internet connection is completely disrupted, and the router itself is usually not at fault. The light may be solid or blinking red, both indicating a serious connectivity issue.

Common Causes

- Fiber Optic Cable Damage:** Physical cuts, severe bends, or kinks in the fiber optic cable can interrupt the signal.
- Service Outage:** ISP maintenance or local network issues can temporarily cut off service.
- Loose or Faulty Connections:** Improperly seated fiber connectors or damaged ports can trigger the red LOS light.
- Router or ONT Malfunction:** Rarely, the device itself may fail, though most red LOS issues are external.
- Power Fluctuations:** Inconsistent power supply to the router or ONT can disrupt signal reception.

Troubleshooting Steps

- Check for ISP Outages:** Visit your ISP's website or social media pages to see if there is a known service disruption.
- Inspect Fiber Cables:** Look for visible damage, ensure cables are properly connected to the WAN/ONT port, and avoid sharp bends.
- Reboot the Router/ONT:** Power off the device, unplug it for 30-60 seconds, then reconnect and power it back on.
- Verify Connections:** Ensure all fiber, LAN, and power cables are securely connected.
- Contact Your ISP:** If the red LOS light persists, report the issue to your provider. They may need to check the fiber line from the splitter to your ONT or investigate a broader network fault.

Additional Notes

- The color of the light on your router hub is irrelevant if the LOS light on the ONT is red; focus on the LOS indicator when reporting issues.
- Fiber optic cables are often color-...
