

Tanzania Cable Tray Span

AI Overview

The typical span for wiremesh cable trays in Tanzania is around 2 meters, depending on the tray type and load. Cable Tray Types and Materials In Tanzania, cable trays are available in light, medium, and heavy-duty types, commonly made from pre-galvanized steel for durability and corrosion resistance. Wiremesh cable trays, such as the Cablofil range, are widely used due to their flexibility, open structure, and ease of installation. These trays allow for visual inspection, efficient cooling, and minimal dust or water retention, enhancing safety and reducing maintenance costs.

Recommended Span Wiremesh Cable Trays: The recommended span between supports is 2 meters for standard installations, as specified by Legrand Tanzania.

Other Cable Trays: For light, medium, or heavy-duty solid trays, the span may vary depending on the tray width, load, and material. Best practice guides suggest that spans should be calculated to safely support the weight of cables and any additional mechanical loads.

Support Systems Cable trays require proper support to maintain structural integrity. Common support options include: Wall brackets, Suspension brackets and hangers, Strut rails. These supports ensure that the tray can safely carry the cables without sagging or deformation.

Installation Considerations Cable trays are not designed to support people; they are intended solely for cable support. The span may need adjustment for heavier cable loads or longer tray widths. Compliance with IEC 61537 and other relevant standards ensures safety and reliability.

Local Availability Cable trays and accessories are available from local suppliers in Tanzania, including J.S. Electromec, Legrand Tanzania, and Shopit, offering a range of sizes, finishes, and support systems. In summary, for standard wiremesh cable trays in Tanzania, a 2-meter span between supports is typical, but the exact spacing should be determined based on tray type, load, and installation standards to ensure safety and durability.
